

## CABLE MANAGEMENT EQUIPMENT

Cable Management equipment is used to support any cabling used in underground networks. Cable bearers and brackets are manufactured from mild steel and galvanised to EN 1461. They are available in a length of 508mm, with 5 hole positions, with a bearer of either 250mm or 170mm.

## BOLT-ON STEP IRONS

Manufactured from ductile iron and galvanised to EN 1461, all steps have an anti-slip design on the top face and 2 No. 15mm diameter holes for easy bolting to the internal chamber walls. This provides a quick, safe way of gaining access to any equipment housed within the chamber.

## BELLMOUTHS

Available in various sizes, bellmouths alleviate the problem of cables snagging or wearing and increase the available space within the chamber for maintenance purposes etc. A blanking plug is available to seal a duct hole that is no longer required.

## ANCHOR IRON

Concreted into the base of the chamber, an anchor iron is used for the pulling and guiding of cables.

## PRE-DRILLED SERVICE

We are happy to pre-drill duct entries and exits, attach step irons, cable bearers and brackets and palletise ready-made chambers for speed site installations. Please contact us to discuss your exact requirements.
